## Checker Jr.: Valve Activator Puts Power in Your Hand

The solution when you need to field test valves or flush lines... just "power up" with Checker Jr. It's a hand-held valve activator that works with all standard solenoids.

It couldn't be easier to use: simply connect the alligator clips to the leads from any 24 volt solenoid and watch the valve spring into action. It makes it easy to test systems when there's no power present, or to check solenoid valve operation without walking back to the controller.

The special battery saver circuit matches output to what's required, allowing the batteries to keep a valve open for up to 3 hours.

Checker Jr. meets the irrigation professional's need for a high-quality, pocket-sized valve power source.
